

## TOTESTERS

The Totesters program gives Turner a clean, organized source-separation system on site while generating the highly detailed, independently verified diversion data Gilead's corporate sustainability requirements demand. Two program options are outlined below.

## PRICING

### OPTION A

#### Totesters Lease + Self-Haul

|                                                                                                      |                     |
|------------------------------------------------------------------------------------------------------|---------------------|
| Totesters lease rate                                                                                 | \$20 / cart / month |
| Dumping at Premier facility                                                                          | \$25 / cart         |
| Turner handles transport. Lease includes repair coverage for normal wear; gross negligence excluded. |                     |

### OPTION B

#### Full-Service Exchange

|                                                                                                                                               |                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Per exchange (18 Totesters)                                                                                                                   | \$850 / exchange |
| Premier manages pickup, transport, processing, and reporting. Includes individual cart weighing and a complete stream-level diversion report. |                  |

## WHY TOTESTERS

### GRANULAR DIVERSION DATA

Each cart is weighed individually by material stream. The result is precise, defensible diversion data — not estimates.

### SUPPORTS STRINGENT GOALS

Stream-level tracking from an RCI Certified facility means diversion reporting that holds up to Gilead's corporate sustainability scrutiny.

### CLEANER, SAFER JOBSITE

Source separation at the point of generation keeps the site organized, reduces contamination, and increases efficiency.
